

PayPalPayment.java

Line-by-Line Code Explanation

```
public class PayPalPayment extends Payment {
```

""" Another specific payment type that inherits from the Payment base class.

```
private String email;
```

```
private String password;
```

""" PayPal uses emails and passwords instead of card numbers. These private fields store that specific data securely.

```
super(amount, currency);
```

""" Sends the amount and currency to the parent class to generate the unique TXN ID.

```
@Override
```

```
public boolean process(...) {
```

""" The custom execution algorithm for PayPal transactions.

```
boolean validAccount = email.contains("@") && password.length() >= 4;
```

""" Validates the credentials by ensuring the email contains an "@" symbol and the password is at least 4 characters long.

```
boolean confirmed = amount <= 250_000;
```

""" Simulates an OAuth redirection to PayPal servers to check the user's balance. Declines anything over \$250,000.
