

PayPalPayment.java

Teacher's Guide & Speaker Notes for Presentation

TEACHING THE CLASS: Sibling Independence

```
public class PayPalPayment extends Payment
```

How to explain this: Use this file to show how two children of the same parent can be totally different. Tell the audience: "Unlike the Credit Card class, PayPal doesn't use CVVs, it uses emails and passwords. But because it extends Payment, it still plugs perfectly into our system."

TEACHING THE ALGORITHM: Custom Validation

```
@Override  
public boolean process(...)
```

How to explain this: Walk through the custom logic here. Explain how we validate by checking for an "@" symbol in the email. Then explain how it simulates an OAuth redirection to PayPal's servers to check the user balance, returning true or false based on whether the amount is under \$250k.
