

BankTransferPayment.java - Explanation

ALGORITHM / EXECUTION FLOW:

1. Takes routing and account numbers.
2. Simulates an interbank settlement process instead of instant authorization.

SECTION 1: SPECIFIC STATE

Specific fields: bankName, accountNumber, and routingCode.

SECTION 3: THE OVERRIDDEN ALGORITHM

Validates the account and routing numbers. Then, instead of an instant network auth, it simulates clearing house / interbank communication to settle the transfer.
