

PayPalPayment.java - Explanation

ALGORITHM / EXECUTION FLOW:

1. Constructor saves email/password, sends amount up to parent class.
2. Overrides process() to perform PayPal-specific validation.

SECTION 1: SPECIFIC STATE (Encapsulation)

Specific fields: email and password. No card data exists here.

SECTION 3: THE OVERRIDDEN ALGORITHM

This shares the exact same method signature as CreditCardPayment.process(), but the internal logic is entirely different. The PaymentProcessor doesn't care **how** this works, only that it **does** work. It checks for the '@' symbol in the email and simulates a balance check.
