

BankTransferPayment.java

Line-by-Line Code Explanation

```
public class BankTransferPayment extends Payment {
```

""" The third child class inheriting from the Payment base class.

```
private String bankName;
```

```
private String accountNumber;
```

```
private String routingCode;
```

""" Private variables holding the sensitive banking details required for a wire transfer.

```
super(amount, currency);
```

""" Calls the parent constructor to initialize the base transaction data.

```
boolean validDetails = accountNumber.length() >= 6 && routingCode.length() > 0;
```

""" Validates that the account number is long enough and the routing code isn't empty.

```
boolean settled = amount <= 1_000_000;
```

""" Simulates an interbank clearing house settlement instead of an instant card authorization. Allows transfers up to \$1,000,000.
